# ABSTRACT OF THE DISCLOSURE

A system provides self-generated documents which may include statements, summaries, reports, and transactions and the system conducts transactions conforming to the documents. The system includes a Designer responsive to operator input instructions to generate computer-like control commands to a server which, in turn, generates commands for controlling a computer. The system depends in part on pre-stored data which establishes parameters in which the transaction may be carried out. Using the pre-stored data, in conjunction with the generated documents, completed forms may be generated and thereupon allowing a final report to be automatically generated. The report may thereupon be displayed to an end user.
